
2006 UNITED STATES NATIONAL CHEMISTRY OLYMPIAD

PART III — LABORATORY PRACTICAL

Student Instructions

Introduction

These problems test your ability to design and carry out laboratory experiments and to draw conclusions from your experimental work. You will be graded on your experimental design, on your skills in data collection, and on the accuracy and precision of your results. Clarity of thinking and communication are also components of successful solutions to these problems, so make your written responses as clear and concise as possible.

Safety Considerations

You are required to wear approved eye protection at all times during this laboratory practical. You also must follow all directions given by your examiner for dealing with spills and with disposal of wastes.

Lab Problem 1

Turmeric, a natural compound, is added to mustard for flavor and color. It changes color from yellow to red at a pH of 7.4. Mustard also contains acetic acid. Given a sample of 0.50 M NaOH and the packets of mustard, create and perform an experiment to determine the mass percentage of acetic acid in mustard.

Lab Problem 2

Given a sample of 3.0 M hydrochloric acid, phenolphthalein, and some common laboratory equipment, devise an experiment using both *qualitative* and *quantitative* evidence to determine the provided unknown metal given these possible choices: Ag, Al, Ca, or Cr.

Answer Sheet for Laboratory Practical Problem 1

Student's Name: _____

Student's School: _____ Date: _____

Proctor's Name: _____

ACS Section Name : _____ Student's USNCO test #: _____

1. Give a brief description of your experimental plan.

This is a titration experiment. Yellow mustard must be between 2.6 - 3.5% acetic acid by law (See: Current CFR 21 for 2005 [<http://www.gpoaccess.gov/cfr/index.html>] <http://www.gpoaccess.gov/cfr/index.html>). Yellow mustard contains turmeric, here used as an indicator for this experiment.

Before beginning your experiment, you must get

Examiner's Initials:
